FINANCIAL INFRASTRUCTURE MANUAL

Billing Architecture Protocol, Enterprise Licensing Models, & Sovereign Settlement Systems

Document Version: 2.1.0 (May 2026)

Classification: Confidential - Financial Operations

Target Audience: CFO Office, Billing Engineers, Enterprise Accounts

Author: Strategic Finance & Operational Infrastructure Division

1. The Flat-Rate Compute Philosophy: Eradicating Token-Based Volatility

1.1 The Instability of Variable API Pricing

The standard artificial intelligence industry utilizes variable, consumption-based billing frameworks centered around individual token processing volume. This approach introduces massive economic instability into enterprise finance departments. Because prompt lengths, agent memory paths, and multi-modal synthesis steps can fluctuate wildly on a day-to-day basis, corporate clients are unable to reliably forecast their monthly IT operational spend.

1.2 The Selim.ai Predictable Model Alternative

Selim.ai fundamentally rejects consumption-based billing models. Because our systems are compiled from scratch and run on dedicated, bare-metal hardware nodes within the Selim Compute Spine (SCS), we pass structural efficiencies directly to clients through a flat-rate infrastructure licensing architecture. Clients pay an unvarying, fixed annual fee for dedicated hardware allocation lines. Processing capacity is governed by hardware capability limits, meaning companies can query our platforms continuously without incurring escalating cost penalties.

2. Enterprise Node Licensing & Pricing Architecture

2.1 Core Tier Definitions

Our licensing architecture scales predictably with the size and operational demands of enterprise deployments. This structure establishes explicit boundaries for hardware compute allocations, support availability, and system throughput capacities:

Licensing Tier	Hardware Compute Allocation	Throughput Capacities	Annual License Fee
Sovereign Core Node	Dedicated 16× Bare-Metal Hardware Stack	Up to 15,000 requests/min	$120,000 / node
Sovereign Cluster Node	Dedicated 64× Scaled Hardware Array	Up to 75,000 requests/min	$450,000 / cluster
Global Spine Enterprise	Multi-Region High Availability Backbone	Uncapped structural limits	Custom Bespoke Scaling

2.2 Predictable Multi-Year Contract Frameworks

All enterprise engagements are established on clear multi-year commitments that shield organizations from operational price adjustments. Contracts include guaranteed compute capability paths, enabling corporate clients to scale internal workflows while keeping processing expenses completely flat.

> **The Flat-Rate Cost Guarantee**
>
> Selim.ai contract terms state that if software enhancements increase model performance by 2x within an active contract cycle, the client immediately gains that computing speed advantage at no additional operational cost. We license hardware capability, not model outputs.

3. The Selim Ledger: Lock-Free Internal Usage Accounting Engines

3.1 Bypassing Traditional Third-Party Metering Tools

Relying on external billing tracking platforms introduces network delay spikes and presents critical information security vulnerabilities. To keep operational logging swift and completely isolated, Selim.ai billing calculations route through our proprietary **Selim Ledger Engine**. This tracking system is coded natively into our memory kernels, tracking hardware use without leaking user interaction details.

3.2 Lock-Free Hardware Resource Tracking

The Selim Ledger records core performance metrics—such as clock cycles, processing threads, and vector cache hits—using an atomized, lock-free memory architecture. By avoiding database synchronization barriers, the metering engine remains exceptionally fast, demanding less than 0.05% of available compute power even under peak system loads.

< 0.05%	0.0ms	100%
COMPUTE METERING OVERHEAD	DATABASE SYNC DELAYS	HARDWARE-LEVEL TRANSPARENCY

3.3 Complete Anonymization of Financial Logs

In accordance with our zero-retention privacy frameworks, the Selim Ledger separates usage metrics from the underlying semantic content. The engine registers hardware active runtimes against an encrypted license identifier, completely dropping the text, imagery, or data profiles being processed. This guarantees that internal accounting logs can be fully verified for corporate audits without introducing information exposure risks.

4. Invoicing, Payment Schedules, & Global Currency Settlement

4.1 Structured Corporate Payment Schedules

Licensing transactions follow strict corporate compliance schedules. All standard node allocations are processed via predictable billing cycles to ensure clean financial tracking:

- **Initial Provisioning Fees:** 50% of the first annual fee is required to secure hardware cluster allocations before deployment begins.
- **Standard Settlement Terms:** Invoices are delivered digitally on a Net-30 basis, allowing corporate accounting offices to verify operational parameters before final payment execution.
- **Automated Bank Routing:** All standard transactions process through encrypted corporate clearinghouses, ensuring secure, high-value capital management.

4.2 Global Multi-Currency Clearing Paths

To support global deployments, Selim.ai maintains localized settlement capabilities in key regions, enabling international enterprises to settle software licensing accounts in their native currency without suffering cross-border exchange penalties.

5. Sovereign Infrastructure Metering & Air-Gapped Financial Auditing

5.1 Air-Gapped Network Metering

For high-security operations executing inside air-gapped data centers, Selim.ai implements a fully offline, self-contained billing framework. The system records processing resource stats within a secure, encrypted storage drive built directly into the node stack. Every quarter, a cryptographically signed usage token is exported by the client's internal security team to settle accounting balances, entirely avoiding the need for a live external network hookup.

CRYPTOGRAPHIC BALANCE VERIFICATION LOOP

The exported usage token uses secure SHA-256 signatures to verify processing totals without revealing internal usage profiles. This balance validation mechanism allows government entities to fulfill contract requirements while maintaining complete information security isolation.

6. Dispute Resolution, SLA Deficit Refunding, & Compliance Frameworks

6.1 Hardware Service Level Agreements (SLA)

Selim.ai contract structures explicitly guarantee high hardware availability rates. If unexpected hardware failures drop cluster accessibility below our targeted metrics, financial refund mechanisms apply automatically:

Verified Monthly Compute Availability	Contractual SLA Standing	Automated Service Balance Credit Allocation
99.9% to 100%	Excellent Operational Standing	Standard contract balance applies
99.0% to 99.8%	Minor Availability Delta	5% credit applied to following invoice cycle
95.0% to 98.9%	Significant Availability Interruption	15% credit applied to following invoice cycle
< 95.0%	SLA Compliance Default	Immediate pro-rated cash-equivalent refund

6.2 Transparent Dispute Resolution Lifecycles

When an enterprise account notices a performance discrepancy between internal resource monitors and official billing allocations, they can immediately open a formal resolution ticket. A dedicated billing operations engineer reviews the hardware metrics alongside the account's logs within 5 business days, ensuring clear, data-driven financial corrections.

6.3 Regulatory Compliance & Audit Controls

Our financial accounting systems comply with international standards including SOC 2 Type II and IFRS. By maintaining detailed, immutable audit trails within our secure ledger networks, Selim.ai provides corporate financial compliance teams with clear proof of operational transaction integrity, supporting streamlined annual reporting cycles.
